

### Manual Waypoint Entry in Nav Master III

When working from a waypoint guide or list, it can be more convenient to type in a waypoint's position, rather than by pointing and clicking to enter it. Use the following procedure to do so with Nav Master III:

1. *Enter Route Creation Mode* by right clicking mouse on the chart window. Right click again to select *manual input*. The *lat/lon tab* of the Location Tabbed dialog will appear.
2. Enter the correct lat and lon of the desired location and select *Find* button. The *Find* function will display all charts in your chart path that cover that lat and lon.
3. Double click on the chart you would like to use or single click to highlight the chart and press the *Go/To button*. Nav Master will load the chart and place your waypoint automatically on the chart. If no charts are found in your path that include this location, a plotting sheet will be your only choice.
4. To manually place subsequent waypoints, right click the mouse on the *Chart View* window while in Route Creation Mode and select *To Location* from the menu. This will launch the Location Tabbed dialog. Select the method you wish to use: *Text Name* (location database), *Lat/Lon*, or *Marker*. In all cases Nav Master will show a list of charts that cover that location and allow you to select the chart and automatically create the waypoint at the specified location.
5. To undo the automatic waypoint, click the right mouse button and select *Backup* from the menu.

Be sure to select the correct hemisphere (N or S, E or W)!
